

Bard Woven

diagnostic catheter

BARD

Diagnostic performance without compromises

After more than 30 years, the Bard Woven diagnostic catheter is still setting the standard for reliability and performance. A workhorse in the truest sense, the Woven catheter has been used in more procedures than all plastic diagnostic catheters combined. Reliability, durable construction and clinical versatility have contributed to the Woven catheter's popularity, making it among the most trusted and successful catheters ever introduced.

Platinum electrodes connected to pure silver core conducting wires—used only by Bard—produce the highest resolution electrograms.

The Woven catheter's bioflexibility allows the shaft to soften rapidly at body temperature to a predetermined biosoftness.

- Biosoftening characteristic allows the catheter tip to conform to the endocardial wall for excellent tissue contact.
- Softening response prevents endocardial bounce, providing greater stability and better signal quality.
- Mapping accuracy is enhanced through the combination of bioflexibility, stable positioning, and high-resolution electrograms.

To produce woven bioflexibility, the woven core is impregnated with a proprietary polymer in an environment of strictly-controlled temperature and pressure.

Interweaving 16 strands of pure silver core conducting wire provides excellent conduction with low impedance.

More than 100 configurations are available to meet virtually any diagnostic need.

Ordering Information

Bard Woven Diagnostic Catheters

Item No.	French	Curve	Electrode Spacing	Poles	Usable Length
